

## The chemical composition of Earth's atmosphere VI: anthropogenic inputs

Mole %	Name	Chemical formula	Residence Time	Anthropogenic input
78.084	Nitrogen	N <sub>2</sub>	10 <sup>6</sup> -10 <sup>7</sup> yea	
20.948	Oxygen	O <sub>2</sub>	3000-10,000 y	
0.934	Argon	Ar	Forever	
0.004 - 4	Water vapor	H <sub>2</sub> O	~10 days	
0.0385 (385 ppm)	<b>Carbon dioxide</b>	<b>CO<sub>2</sub></b>	2-10 years	<b>A</b>
0.001818 (18.18 ppm)	Neon	Ne	Forever	
0.000524 (5.24 ppm)	Helium	He	~10 <sup>6</sup> years	
0.00017 (1.7 ppm)	<b>Methane</b>	<b>CH<sub>4</sub></b>	2-10 years	<b>A</b>
0.000114 (1.14 ppm)	Krypton	Kr	Forever	
0.00005 - 0.0010	Stratospheric ozone	O <sub>3</sub>		
0.000055 (0.55 ppm)	<b>Hydrogen</b>	<b>H<sub>2</sub></b>	4-8 years	<b>A</b>
0.000033 (0.33 ppm)	<b>Nitrous oxide</b>	<b>N<sub>2</sub>O</b>	5-200 years	<b>A</b>
0.0000050 - 0.0000200	<b>Carbon monoxide</b>	<b>CO</b>	60-200 days	<b>A</b>
0.0000087 (87 ppb)	Xenon	Xe	Forever	
0.0000010 - 0.0000500	<b>Tropospheric ozone</b>	<b>O<sub>3</sub></b>		<b>A</b>
0.0000005 - 0.0000020	<b>NMHC</b> (Non-methane hydrocarbons)	<b>C<sub>x</sub>H<sub>y</sub></b>		<b>A</b>
0.0000000540 (540 ppt)	<b>CFC12</b>	<b>CF<sub>2</sub>Cl<sub>2</sub></b>	>80 years	<b>AA</b>
0.00000005 (500 ppt)	<b>Carbonyl sulfide</b>	<b>OCS</b>	~ 2 years	<b>A</b>
0.0000000265 (265 ppt)	<b>CFC11</b>	<b>CFCl<sub>3</sub></b>	~80 years	<b>AA</b>
0.00000001 - 0.000001	Hydrogen peroxide	H <sub>2</sub> O <sub>2</sub>	1 day	
0.00000001 - 0.0000001	Formaldehyde	CH <sub>2</sub> O	5-10 days	
0.0000000098 (98 ppt)	<b>Carbon tetrachloride</b>	<b>CCl<sub>4</sub></b>	≥ decades	<b>AA</b>
0.0000000065 (65 ppt)	<b>Methylchloroform</b>	<b>CH<sub>3</sub>CCl<sub>3</sub></b>	~7 years	<b>AA</b>
0.000000001 - 0.0001	<b>Nitrogen oxides</b>	<b>NO<sub>x</sub></b>	A few days	<b>A</b>
0.000000001 - 0.0000001	Ammonia	NH <sub>3</sub>	A few days	
0.000000001 - 0.0000001	<b>Sulfur dioxide</b>	<b>SO<sub>2</sub></b>	hours to weeks	<b>A</b>
0.000000001 - 0.00000001	Dimethyl sulfide	CH <sub>3</sub> SCH <sub>3</sub>	<1 day	
0.0000000001 - 0.00000003	<b>Carbon disulfide</b>	<b>CS<sub>2</sub></b>	~40 days	<b>A</b>
0.0000000005 - 0.00000005	<b>Hydrogen sulfide</b>	<b>H<sub>2</sub>S</b>	<5 days	<b>A</b>
0.0000000002 (2 ppt)	Hydroperoxyl radical	HO <sub>2</sub>		
0.00000000005 (0.05 ppt)	Hydroxyl radical	OH	≤ a few se	

In this series, we've already observed that the atmosphere's fifth and eighth most abundant components, CO<sub>2</sub> and methane, have major anthropogenic inputs. Methane's anthropogenic inputs are largely from agriculture, and the same is true for N<sub>2</sub>O, in that bacteria attack fertilizers and animal waste. However, that's just the beginning, as the table at left shows with its rightmost column.

One striking group of components is the halogen-bearing carbon compounds (CFCs, carbon tetrachloride, and methylchloroform). They're all components that come almost entirely from human rather than natural sources. They're all rather stable and thus have relatively long residence times (decades rather than days to years). CFCs were generated largely as refrigerants, and carbon tetrachloride and methylchloroform have major industrial applications, commonly as solvents.

Another source of anthropogenic inputs is partial combustion of carbon-based fuels and their minor components. That accounts for much of the output of CO, NO<sub>x</sub>, and SO<sub>2</sub>, and NMHC. NO<sub>2</sub> in sunlight breaks down to form NO and O, and the latter combines with O<sub>2</sub> to form O<sub>3</sub> (ozone). Even the human production of H<sub>2</sub> is related to burning of gasoline, via the reaction CO + H<sub>2</sub>O → CO<sub>2</sub> + H<sub>2</sub> (Barnes et al., 2003, *Hydrogen in the atmosphere* . . . : *JGR*, v. 108, p. 4197 ff).

A = anthropogenic;  
AA = all anthropogenic

Sources: see Part I of this series. The column labelled "anthropogenic input" is mostly from Prinn (2003).
