

Maps and cross-sections VII

An enigmatic volume of the Earth penetrated by five boreholes:

A model of the previously enigmatic volume, as suggested by our cross-sections and maps.

This is the last of seven pages intended to introduce the idea of understanding subsurface geology through cross-sections and maps. Further *PGSG* pages will explain much more about the logs that are the fundamental data for these constructs, about how to make cross-sections and maps, and about the implications of those documents for predicting the location of petroleum accumulations.
